### COURSE OBJECTIVES

To differentiate between numerical methods and numerical analysis and to apply numerical analysis concepts for solving various analytical and real life problems.

### COURSE OUTCOMES

After completing this course student will be able to

- CO1:** Acquire knowledge of numerical analysis and fundamentals of programming.
- CO2:** Solve the algebraic, transcendental and system of linear equation using numerical methods.
- CO3:** Develop the concept of interpolation and apply it in finding the differentiation and integration.
- CO4:** Utilize the concept and applications of difference equations.
- CO5:** Apply the numerical methods to solve ordinary and partial differential equations.

### COURSE CONTENTS

#### THEORY

Unit 1 Errors and approximations, Number representation, Numerical Analysis and numerical Methods, Numerical stability, ill condition and convergence, numerical algorithm and Numerical Flow Charts, an Introduction of MATLAB, overview of C features its use in Numerical Methods.

Unit 2 Solution of Algebraic and Transcendental Equations: Bisection (or Bolzano) method, method of false position, Newton Raphson method. Solution of Simultaneous algebraic equations: Direct method- Gauss Elimination method Gauss Jordan method, Iterative method-Jacobi's method, Gauss Seidal method.

Unit 3 Interpolation: Introduction, Interpolating polynomial, Missing term techniques, Newton's forward and backward interpolation formula, central difference formula, Lagrange's interpolation formula for unequal distances. Numerical differentiation: derivatives from forward and backward interpolations, Numerical Integration: General quadrature formula, formulae derived from it.

- Unit 4      Difference equations: Definition, formation of difference equations, linear difference equations with constant coefficients. Difference equations reducible to linear form. Simultaneous difference equations with constant coefficient.
- Unit 5      Numerical solution of Ordinary Differential Equations: Initial value problem, Euler's method, Picard's method, Taylor's method, modified Euler's method, Runge method, Runge-Kutta method, Adams-Bashforth method, Milne's method. Numerical solution of Partial Differential Equations: Classification of second order equations, finite difference approximations to partial derivatives. Elliptic, Parabolic and Hyperbolic equations.

**ASSESSMENT**

1. Internal Assessment for continuous evaluation, mid-term tests, , tutorials, class performance, etc. (30%).
2. End semester Theory Exam (70%)

**TEXT BOOKS RECOMMENDED**

1. K Sankara Rao, Numerical methods for Scientist and Engineers, Prentice Hall of India.
2. Balaguruswamy E., Numerical methods, Tata McGraw-Hill Publishing Company Ltd., New Delhi.

**REFERENCE BOOKS**

1. Pradeep Niyogi, Numerical Analysis and Algorithm, Tata Mcgraw-Hill Publishing Com. Ltd, New Delhi.
2. Jain N.K., Iyengar, S.R.K. and Jain R.K., Numerical methods for scientific and Engineering Computations, Wile Eastern Ltd.,1984.
3. Steven C. Chapra and Raymond P. Candle, Numerical methods for Engineers, 5<sup>th</sup> edition, Tata McGraw hill publishing company Ltd., New Delhi2006.

4	--	--	4	--	--	30	70	--	--	100

**COURSE OBJECTIVE**

To introduce the general concepts of digital logic design and its applications, architecture of memory and I/O organization in a computer system and fundamentals concepts of parallel computing, pipeline processing, vector processing and array processing.

**COURSE OUTCOMES**

After completing this course student will be able to

- CO1:** Acquire the knowledge of number systems, general concepts of digital devices and their use in combinational and sequential logic circuit design and solve Boolean expression using Karnaugh map method.
- CO2:** Discuss the working process, structure and organization of various parts of a system memory hierarchy and CPU.
- CO3:** Identify the internal organization of DMA, Input/Outputs processor and relations between their main components.
- CO4:** Explain the advanced concepts of parallel processing, different types of Interprocessor arbitration techniques, inter processor communication and synchronization.
- CO5:** Analyze the fundamentals concepts of pipeline processing, vector processing, array processing and RISC/CISC architectures.

**COURSE CONTENTS**

**THEORY**

Unit 1 Introduction to CA : Number system , Von Neumann Model , Digital devices: Logic gates , flip flops , Logic Design : Boolean Algebra , K-map , Method of simplification of Logic expression , Combinational & Sequential circuits.

Unit 2 CPU Organization: ALU, Control unit, Registers, Memory organization, memory properties, Associative memory, Cache memory, machine language level, instruction types, Input Output Organization: I/O interface. Modes of transfer.

Unit 3 Memory: Memory mapped I/O and I/O mapped I/O, programmed I/O, concepts of interrupts and DMA, I/O processors, concept of hardwired and micro programmed control instruction.

Unit 4 Introduction to advanced architecture: Parallel processing, Interconnection structure, Interprocessor Arbitration: Serial, Parallel and Dynamic arbitration Procedure, Interprocessor Communication and Synchronization, Cache Coherence.

Unit 5 Pipeline processing: Concepts , Arithmetic and Instruction Pipeline , Vector, and Array processing: vector operation, matrix multiplication, memory interleaving, Attachedarray Processor, SIMD Array Processor. Comparison of RISC and CISC.

#### **ASSESSMENT**

1. Internal Assessment for continuous evaluation, mid-term tests, tutorials, class performance, etc. (30%).
2. End semester Theory Exam (70%)

#### **TEXT BOOKS RECOMMENDED**

1. Moris Mano, Computer System Architecture, Prentice Hall of India.
2. William Stallings, Computer Organization and Architecture, 7<sup>th</sup> Edition, Pearson Education Prentice Hall of India,2009.

#### **REFERENCE BOOKS**

1. Andrew S.Tanenbaum, Structured Computer organizations, 5<sup>th</sup> Edition, Pearson Education Prentice Hall of India,2006.
2. A.P.Godse and D.A. Godse, Computer Architecture, 4thEdition, Technical Publications Pune,2009.

						C	END SEM	SW	END SEM	
4	--	--	4	--	--	30	70	--	--	100

**COURSE OBJECTIVE**

To introduce the concept of set theory, Boolean algebra, Graph theory, Automata theory, theory of formal languages, grammars, ring and field theory.

**COURSE OUTCOMES**

After completing this course student will be able to

- CO1:** Use the basic concepts of set theory, Boolean algebra and mathematical logic for analyzing propositions.
- CO2:** Illustrate various graphs, solving minimal weight problems and shortest path problems using suitable algorithm in graph theory.
- CO3:** Evaluate basic properties of formal languages, grammars and finite automata.
- CO4:** Develop the concepts of ring theory and modules theory with their properties.
- CO5:** Apply basic theory of vector space in field extensions.

**COURSE CONTENTS**

**THEORY**

- Unit 1 Formal Logic: Basic preliminaries Sets, functions, relations (equivalence relations and poset) for logic and subsequent development; statements, symbolic representation and tautologies, Quantifiers, Predicates, Propositional and Predicate calculus, Proofs & method of proofs, Algebra and Lattices: Boolean expression, Logic gates and circuits, Karnaugh maps, Lattices, Distributive lattice.
- Unit 2 Graph Theory: Definition of (Undirected) Graphs, Paths, Circuits, Cycles and Subgraphs, Degree of Vertex, Connectivity, Complete regular and bipartite graphs and Complete Bipartite Graphs, Kuratowski's Theorem (Statement only) and its uses, planar graphs and their properties, Euler's formula for connected Planar Graphs, Graph colourings, directed graphs, Trees and Binary Trees, Spanning Trees, Cut-sets, Minimal Spanning Trees, Euler's Theorem on the existence of Eulerian paths and circuits, Directed Graphs, In degree and Out degree of a vertex, weighted undirected graphs, Matrix representation of Graph.

- Unit 3 Introduction to Languages, Operation on Languages, Regular Expression, Regular Languages, Grammars, Language generated by a grammar, Types of Grammars, Finite State Automata, Pumping Lemma , Finite State Machine, Turing Machine.
- Unit 4 Algebra: Review of basic concepts of group theory.Rings: Some basic concepts, Algebra over fields, ideals, Minimal, Maximal & prime ideals, PID and UFD, Euclidean domain, Polynomial rings. Modules : Definition of modules, properties of modules, sub modules, linear sum of two sub modules, direct sum of sub modules , homomorphism of modules, kernel of a homomorphism, cyclic modules.
- Unit 5 Vector space: Review of Basic Concepts. Field: Extension field, Algebraic and Transcendental Extension field, roots of Polynomial, finite field.

### **ASSESSMENT**

1. Internal Assessment for continuous evaluation, mid-term tests, tutorials, class performance, etc. (30%).
2. End semester Theory Exam (70%)

### **TEXT BOOKS RECOMMENDED**

1. Herstein, I.N, Topics in Algebra, Vikas Publications, Delhi-6, 1969.
- 2.SwapanK.Sarkar, AText Book of Discrete Mathematics, S. Chand &Company Ltd., N Delhi,2003.
- 3.S. Lipschutz M. Lipson, Schaum’s Outline of Theory and Problems of Discrete Mathematics, 2<sup>nd</sup> edition Tata McGraw Hill Publishing Company Ltd., NewDelhi,1997

### **REFERENCE BOOKS**

4	--	--	4	-	--	30	70	--	--	100

**COURSE OBJECTIVE**

To introduce the concept of Ordinary Differential Equations, Partial Differential Equations and their applications.

**COURSE OUTCOMES**

After completing this course student will be able to

- CO1:** Solve the problems based on existence and uniqueness of solutions of an initial value problem of first order using the concept of Lipschitz condition.
- CO2:** Develop the concepts of existence and uniqueness of solutions of an initial value problem of n-th order linear differential equations and apply Wronskian and its properties to analyze linear dependence of solutions.
- CO3:** Classify PDE and solve their canonical form.
- CO4:** Apply and solve PDE in various coordinate systems using the method of separation of variables.
- CO5:** Acquire the knowledge of Green's function and its applications in solving Laplace, Wave equation and Helmholtz theorem.

**COURSE CONTENTS**

**THEORY**

Unit 1 Theory of Ordinary Differential Equation: Initial and Boundary Value Problems, Picard's Iterations, Lipschitz conditions, Sufficient conditions for being Lipschitzian in terms of partial derivatives, Examples of Lipschitzian and Non-Lipschitzian functions, Picard's Theorem for local existence and uniqueness of solutions of an initial value problem of first order which is solved for the derivative, examples of problems without solutions and of equations where Picard's iterations do not converge .

Unit 2 Theory of Ordinary Differential Equation: Existence & Uniqueness for Ordinary Differential Equation, Wronskian and Linear independence, Initial value problem for nth order differential equation, Linear equations with variable coefficients, Lipschitz condition.

Unit 3 Fundamental concepts of partial differential equation, Elliptic differential Equations, Parabolic Differential equations, Hyperbolic Differential Equations.

Unit 4 Method of separation of variables: Laplace, Diffusion and Wave equations in Cartesian, cylindrical and spherical polar coordinates, Boundary value problems for transverse vibrations of strings and heat diffusion in a finite rod, Classification of linear integral equations, Relation between differential and integral equation.

Unit 5 Green's Functions: Introduction, Green's Function for Laplace Equation, Green's Function for the Wave Equation-Helmholtz Theorem.

#### **ASSESSMENT**

1. Internal Assessment for continuous evaluation, mid-term tests, tutorials, class performance, etc. (30%).
2. End semester Theory Exam (70%)

#### **TEXT BOOKS RECOMMENDED**

1. E. A. Coddington, An Introduction to Ordinary Differential Equations, Prentice Hall of India, New Delhi, 1968.
2. ZafarAhsan, Differential Equations and their Application, Prentice-Hall of India Pvt. Ltd., New Delhi, 2004.

### COURSE OBJECTIVE

To introduce the concepts of mathematical foundations of computation using automata theory, formal languages and grammar, turing machine with their complexity and computability.

### COURSE OUTCOMES

After completing this course student will be able to

- CO1:** Acquire the knowledge of basic concepts of set theory, graphs, preposition and predicate calculus.
- CO2:** Create the ideas of finite automata and its different types together with formal languages and grammars, regular grammar and regular languages.
- CO3:** Use the fundamental concepts and properties of context-free languages , context- free grammar and solve various problems by applying normal form techniques for context free-grammars.
- CO4:** Analyze and design Pushdown Automata machine for given CF language.
- CO5:** Gain deeper knowledge of Turing machines and solve computational problems regarding their computability and complexity.

### COURSE CONTENTS

#### THEORY

Unit 1 Introduction: Review of sets, Relations and Functions, Graphs, Trees, Principal of Induction, Languages and Grammers-Fundamental Concepts, Preposition and Predicate Calculus.

Unit 2 Theory of Automata: Definition of Automata; Description of finite Automata-Deterministic finite Accepters (DFAs), Non-deterministic finite Accepters (NFAs),Regular expression, Regular Grammars and Languages, Properties of Regular Languages, Pumping Lemma for Regular Languages.

Unit 3 Context Free Languages: Context free-grammars and Derivation Trees, Parsing and ambiguity, Normal form for Context free-grammars -Chomsky and Greibach normal form, Pumping Lemma for Context Free languages, Properties of Context Free languages.

Unit 4 Pushdown Automata: Basic Definition of Pushdown Automata, Non Deterministic Pushdown Automata and Deterministic Pushdown Automata, Pushdown Automata and Context Free languages.

Unit 5 Turing Machines: Definition of a Turing Machine, Turing Machine as Language, Accepters, Turing's Thesis, Universal Turing Machine, Linear Bounded Automata, Computational complexity theory- P and NP Problems.

### **ASSESSMENT**

1. Internal Assessment for continuous evaluation, mid-term tests, tutorials, class performance, etc. (30%).
2. End semester Theory Exam (70%)

### **TEXT BOOKS RECOMMENDED**

1. Peter Linz, An Introduction to Formal Languages and Automata, 2<sup>nd</sup> Edition, Narosa Publishing House, 1997.
2. K.L.P. Mishra, N. Chandrasekaran, Theory of Computer Science Automata, Language and Computation, 3<sup>rd</sup> Edition, Prentice Hall of India, 2007.

**COURSE OBJECTIVE**

To introduce the basic concepts of Database System and Architecture, various Data Models, Structured Query Language (SQL), Normalization theory and Transaction Processing.

**COURSE OUTCOMES**

After completing this course student will be able to

- CO1:** Acquire the knowledge of basic concepts of various data model used in database design.
- CO2:** Design ER modeling, relational modeling and apply relational database theory to describe relational algebra expression.
- CO3:** Write SQL queries to retrieve information from databases and develop the concepts and importance of indexing, view and sequences.
- CO4:** Analyze the basic concepts of Normalization theory, network and hierarchical data models.
- CO5:** Use the concept of transaction processing, concurrency control and recovery system in database.

**COURSE CONTENTS**

Unit-I Database System Concepts and Architecture: Categories of Data Models, Schema, Instances and Database State, Database Architecture, Data Independence and Database Languages.

Unit-II Data Modeling using Entity-Relationship Model, Relational Model, Relational Algebra.

Unit-III Structured Query languages (SQL): Data Types, Basic Queries in SQL, Insert, Retrieve, Delete and Update data using SQL, Types of Data Constraints, Computation on Table Data, Grouping data from Tables, Indexing, Sequences and VIEWS in SQL.

Unit-IV Concepts of Network and Hierarchical Data Models, Normalization Theory: Functional dependency, First Normal form, Second Normal form, Third Normal form, Boyce-Codd Normal form, Multivalued dependency and Fourth Normal form, Join dependency and First Normal form.

Unit-V Introduction to Transaction Processing, Characterizing Schedules, Concurrency Control Techniques, Database Recovery Concepts and Techniques.

### **ASSESSMENT**

1. Internal Assessment for continuous evaluation, mid-term tests, seminar, tutorials, class performance, etc.(30%)
2. End Semester Theory Exam(70%)

### **TEXT BOOKS RECOMMENDED**

1. Ramez Elmasri and Shamkant B. Navathe, Fundamentals of Database Systems, 7<sup>th</sup> Edition, Pearson,2016.
2. H.F Korth, A. Silberchatz and S. Sudarshan, Database Systems Concepts,6<sup>th</sup> Edition McGraw Hill, 2010.

**COURSE OBJECTIVE**

To introduce operation research for solving assignment, transportation, sequencing, Dynamic and Non-Linear Programming problems.

**COURSE OUTCOMES**

After completing this course student will be able to

- CO1: Formulate and solve linear programming problems using graphical, Simplex, dual Simplex and Big M methods.
- CO2: Solve Assignment, Transportation and Game Theory problems.
- CO3: Apply sequencing and scheduling problems.
- CO4: Utilize the basic concepts related to information theory and its applications.
- CO5: Construct and apply dynamic programming problems and non-linear programming problems.

**COURSE CONTENTS**

**THEORY**

- Unit 1 Introduction to Operations research, Mathematical formation of Linear Programming problems, Graphical solution as two phase method, Linear Programming problems, Simplex method, Big M method, Duality in linear programming, Dual simplex method, degeneracy.
- Unit 2 Assignment and Transportation problems, Game theory: Simple and mixed strategy game, two persons zero sum games, Dominance property.
- Unit 3 Sequencing and scheduling: Sequencing problem with n jobs and m machines, optimal sequence algorithm, Critical path determination by CPM and PERT methods.
- Unit 4 Information Theory: Basics ideas, Communication system, Noisy and noiseless channel, Channel matrix, Mathematical Definition of information, Measure of uncertainty and properties of entropy function, Channel capacity, efficiency and redundancy encoding, Shannon Fano method.

Unit 5 Dynamic and Non-linear programming: Concept of dynamic programming, decision tree and Bellman's principle of optimality, Solution of problem with finite number of stages, minimum path problem. Lagrangian method, Kuhn- Tucker conditions, Quadratic programming.

#### **ASSESSMENT**

1. Internal Assessment for continuous evaluation, mid-term tests, tutorials, class performance, etc. (30%).
2. End semester Theory Exam (70%)

#### **TEXT BOOKS RECOMMENDED**

**COURSE OBJECTIVE**

To introduce the concept of Lebesgue measure theory, Fourier Series, Real and Complex Analysis.

**COURSE OUTCOMES**

After completing this course student will be able to

- CO1:** Acquire the knowledge of measurable sets, measurable functions and Lebesgue integration.
- CO2:** Develop the concepts of Fourier series with its convergent criteria and consequences of Riemann-Lebesgue theorem.
- CO3:** Use the concept of analytic functions, conformal mappings and their properties, application of mean value property, Poisson and Schwartz's theorem.
- CO4:** Solve the integration of function of complex variable using Cauchy's theorem and integral formula.
- CO5:** Explain the concept of Cauchy residue theorem and its application.

**COURSE CONTENTS**

**THEORY**

- Unit 1 Measure theory, function of bounded variation, measurable non-measurable sets, Borel sets, measurable functions, Lebesgue integral for bounded function over a set of finite measure, Lebesgue integral for unbounded function, theorems on convergence in measure, Lebesgue class  $L^p$ .
- Unit 2 Fourier series: Convergent criteria of Fourier series, Convergent problem, Dirichlet's Conditions, Riemann-Lebesgue Theorem and its Consequences and Fourier analysis.

- Unit 3 Concept of analytic function, C-R equations, Conjugate function, harmonic functions, the mean value property, Poisson's formula, Schwarz's theorem and the reflection principle. Conformality, areas and closed curves analytic function in regions, Conformal mapping, length and area, linear transformation, the linear groups, cross-ratio symmetry and oriented circles, use of level surface.
- Unit 4 Complex Integration: Line integrals, Rectifiable arcs, Cauchy's theorem for a rectangle, Cauchy's theorem for a circular disk. The index of a point with respect to a closed curve, Cauchy's integral formula.
- Unit 5 The general form of Cauchy's theorem and calculus of residues: chains and cycles, simple connectivity, Exact differentials in simply connected regions, Residue theorem, the argument principle, Branch points.

#### **ASSESSMENT**

1. Internal Assessment for continuous evaluation, mid-term tests, tutorials, class performance, etc. (30%).
2. End semester Theory Exam (70%)

**COURSE OBJECTIVE**

To introduce the concepts of Topological space, Normed linear space, Hilbert space, Finite dimensional spectral theory and Integral Equations.

**COURSE OUTCOMES**

After completing this course student will be able to

- CO1:** Acquire the knowledge of continuous functions, homeomorphisms, compact spaces, connected spaces and separation axioms over various topological spaces.
- CO2:** Explain the proof and application of some famous theorems as; Hahn-Banach theorem, closed graph theorem and Uniform bounded principle in functional analysis.
- CO3:** Analyze the concept of Hilbert space and its properties, application of Bessel's inequality, Riesz representation theorem.
- CO4:** Use the concept of various operators with their properties, application of spectral theorems and fixed-point theory.
- CO5:** Solve the problems on integral equation and use of green's function in boundary value problems.

**COURSE CONTENTS**

**THEORY**

- Unit 1 Topological Space: Definition, Open Set, Closed Set, Continuous mapping, Homomorphism, Separation axioms, Connectedness and Compactness.
  
- Unit 2 Normed Linear Spaces: Branch space, Quotient space, continuous linear transformation, Hahn Banach theorem and its consequences, Conjugate space and separability. The Natural imbedding of the normed linear closed graph theorem, The uniform boundedness principle.
  
- Unit 3 Hilbert Spaces: Definition and some of its properties, orthonormal complements, the projection theorem, orthonormal sets. The Bessel's inequality, Fourier expansion and Parseval's equation (without proof) Riesz representation theorem.

Unit 4 Finite Dimensional Spectral Theory: Basic preliminary definitions of adjoint of an operator, self-adjoint operators, normal and unitary operators, And their properties. Projections, the spectral theorem, fixed-point theory and its applications.

Unit 5 Integral Equations: Preliminary concepts, formulation of integral equations and Classification of linear integral equations. Integral differential equations, conversions of ordinary differential equations to integral equations. Solutions of integral equations with separable kernels. Characteristics number and eigen functions, Fredholm determinant method. Construction of Green's functions and its use in solving the boundary value problems, reductions of B.V. problems to integral equations. Resolvent kernel of the integral equations, method of successive approximation, convolution type kernels integral transform methods.

### **ASSESSMENT**

1. Internal Assessment for continuous evaluation, mid-term tests, tutorials, class performance, etc. (30%).
2. End semester Theory Exam (70%)

### **TEXT BOOKS RECOMMENDED**

**COURSE OBJECTIVE**

To develop programming skills, learn the basic concepts of OOPS, object-oriented program analysis, design and testing.

**COURSE OUTCOMES**

After completing this course student will be able to

- CO1:** Use the basic concepts and importance of object oriented programming system, difference between structured oriented and object oriented programming features.
- CO2:** Apply the concepts of objects, classes, function overloading, operator overloading for developing programs.
- CO3:** Develop the concepts of inheritance, polymorphism and its different types.
- CO4:** Investigate principles and different methods of object-oriented analysis and design.
- CO5:** Acquire the knowledge of basic aspects of object-oriented program testing with its different methods, techniques of Rapid Prototyping and UML.

**COURSE CONTENTS**

**THEORY**

- Unit 1 Introduction to Object Oriented Programming fundamentals, Comparison with procedural programming, Basic concepts of object oriented programming, Merits and demerits of OO methodology, Elements of the object model.
- Unit 2 Object oriented concepts: Concepts of objects and classes, attributes and methods, Access modifiers, static member of a class, Instances, Message passing, Constructors and destructor, data abstraction, encapsulation and data hiding.
- Unit 3 Inheritance: purpose and its types, Polymorphism: Introduction, Method of overriding and overloading, compile time and run time polymorphism.
- Unit 4 Introduction to object oriented analysis and design: Design concepts, use cases, class diagrams, State Transition diagrams, object diagrams.

Unit 5 Rapid prototyping: Overview, method process and techniques, object oriented testing: Concepts, methods, UML pattern.

### **ASSESSMENT**

### COURSE OBJECTIVES

The objective of the course is to make the students understand the concepts of statistic, sampling, hypotheses, regression analysis and multivariate data analysis.

### COURSE OUTCOMES

After completing this course student will be able to

- CO1:** Use the concept of statistic to solve the related problems.
- CO2:** Describe the hypotheses and perform the large and small sample test.
- CO3:** Develop in-depth understanding of the linear and nonlinear regression model.
- CO4:** Perform the regression modeling and model selection techniques.
- CO5:** Demonstrate the knowledge and skill of multivariate model, methods and techniques for data analysis.

### COURSE CONTENTS

#### THEORY

Unit 1 Statistics: Concepts of statistical population and sample, measures of central tendency, measures of dispersion, Kurtosis and Skewness.

Unit 2 Hypothesis Testing: Introduction-Types of errors, critical region, procedure of testing hypothesis - Large sample tests- Z test for Single Proportion, Difference of Proportion, mean and difference of means, small sample tests- Student's t-test, F-test and Chi-square test.

Unit 3 Simple Regression Analysis: correlation, multiple correlation, partial correlation, introduction to linear and non-linear model, ordinary least square methods, fitting a linear trend, simple linear regression, validating simple regression model using t, F and p test, Developing confidence interval.

Unit 4 Multiple Regression Analysis: Concept of Multiple regression model to describe a linear relationship, Assessing the fit of the regression line, inferences from multiple regression analysis, problem of overfitting of a model, comparing two regression model, prediction with multiple regression equation.

Unit 5 Multivariate Data Analysis: Multivariate data and their diagrammatic representation, Exploratory multivariate data analysis, sample mean vector, sample dispersion matrix, sample correlation matrix, graphical representation, means, variances, co-variances, correlations of linear transforms, six step approach to multivariate model building, Introduction to multivariate linear regression, logistic regression, principal component analysis, factor analysis, cluster analysis, canonical analysis and canonical variables, structured equation modeling (SEM).

#### **ASSESSMENT**

1. Internal Assessment for continuous evaluation, mid-term tests, tutorials, class performance, etc. (30%).
2. End semester Theory Exam (70%).

#### **TEXT BOOKS RECOMMENDED**

1. Manoj Kumar Srivastava and Namita Srivastava, Statistical Inference – Testing of Hypotheses, Prentice Hall of India, 2014.
2. Norman R. Draper, Harry Smith; Applied Regression Analysis, WILEY India Pvt. Ltd. New Delhi; Third Edition, 2015.

#### **REFERENCE BOOKS**

1. Douglas C. Montgomery, Elizabeth A. Peck, G. Geoffrey Vining, Introduction to Linear Regression Analysis, Third Ed., Wiley India Pvt. Ltd., 2016.
2. Johnson, R A., Wichern, D. W., Applied Multivariate Statistical Analysis, Sixth Ed., PHI learning Pvt., Ltd., 2013.

**DEPARTMENT OF APPLIED MATHEMATICS AND COMPUTATIONAL SCIENCE**  
**M.Sc. III Semester**  
**MA 94371: MATHEMATICAL AND STATISTICAL MODELLING**

HOURS PER WEEK			CREDITS			MAXIMUM MARKS

4	--	--	4	--	--	30	70	--	--	100

**COURSE OBJECTIVE**

To introduce the concept of simulation techniques , Markov process, neural network and fuzzy system.

**COURSE OUTCOMES**

After completing this course student will be able to

- CO1:** Design and apply the modeling and simulation techniques to a variety of engineering problems.
- CO2:** Acquire the knowledge of Markov chain and reliability for quality improvement of manufactured products and components.
- CO3:** Gain deeper the concepts of artificial neural networks and apply training algorithms to solve the formalized problem using neural network models.
- CO4:** Use neural networks for practical applications such as character recognition and acquire concept of neural dynamical models.
- CO5:** Discuss basic knowledge of fuzzy sets and fuzzy logic and apply it for practical application.

**COURSE CONTENTS**

**THEORY**

- Unit 1 Simulation Method: Definition of simulation, application of simulation methods, Monte Carlo Methods and its applications, Evolutionary Techniques.
- Unit 2 Markov Process: Application to Reliability and other problems.
- Unit 3 Neural Network: Basic Idea, Artificial neural network and its building blocks, Terminologies, learning rules, McCulloch-Pitts neuron model, Perceptrons: single and multiplayer neural network, Adaline and madaline network, feedback network: Discrete Hopfield network, feedforward network: back propagation network and its rule.

Unit 4 Neural Network (contd.): Neurons as a function, signal monotocity, neural dynamical systems and state spaces, additive neuronal dynamics: Passive membrane decay, additive activation models, LMS Algorithms, linear stochastic approximation, Functional link network.

Unit 5 Fuzzy System: Definition of Fuzzy sets and set operations, Brief idea of theory of possibility, Fuzzy functions, Fuzzy Algebra, Brief idea of fuzzy statistics, Brief idea of modeling of system under uncertain environments.

### **ASSESSMENT**

1. Internal Assessment for continuous evaluation, mid-term tests, , tutorials, class performance, etc.(30%).
2. End semester Theory Exam(70%)

### **TEXT BOOKS RECOMMENDED**

1. S.N. Sivananda, S. Sumathi, S.N. Deepa, Introduction to Neural Network using matlab6.0, Tata McGraw Hill Publishing Company Ltd., New Delhi,2006.
- 2.Ganesh, Introduction to Fuzzy Sets and Fuzzy Logic, Prentice Hall of India Ltd., New Delhi, 2006.

### **REFERENCE BOOKS**

1. Bart Kasko, Neural Networks and Fuzzy System, PHI,New Delhi,2008.
2. K.K. Vinoth, Neural Network and Fuzzy Logic, 1<sup>st</sup> Edition, KATSON Book.
